

Analysis Resource Overview

tools.iedb.org

Presented by: Bjoern Peters, Professor

IEDB Analysis Resource

tools.iedb.org

T cell tools

MHC binding prediction

- MHC I binding prediction
- MHC II binding prediction
- TepiTool

MHC processing prediction

- NetChop/NetCTL/NetCTLpan
- MHC-NP, MHCII-NP

Immunogenicity prediction

- CD4 & CD8 T cell immunogenicity prediction tools

Remove epitopes from therapeutic proteins

- Deimmunization tool

B cell tools

Linear epitope prediction

- BepiPred
- Other methods

Discontinuous epitope prediction

- DiscoTope
- ElliPro

Antibody and TCR structure prediction

- LYRA
- SCEptRe

Analysis tools

Population coverage of epitope set

- Population coverage tool

Degree of conservation

- Conservancy analysis tool

Group peptides based on sequence identity

- Cluster 2.0

Infer restriction in HLA typed subjects

- RATE

Aggregate heterogeneous immune response

- Immunome-browser

Development of prediction tools

- Epitope prediction tools
 - Vaccine, cancer neoantigen studies
- Based on machine learning techniques
 - Experimentally derived data
 - E.g. MHC binding data, Eluted ligand data, T cell assay data

Accessing the Analysis Resource

Epitope Prediction and Analysis

Welcome to the Immune Epitope Database Analysis Resource. It provides a collection of tools for the prediction and analysis of epitopes. It serves as a companion site to the Immune Epitope Database (IEDB), a manually curated database of experimentally determined immune epitopes.

The tools contained fall into the following categories:

- T Cell Epitope Prediction Tools**
This set of tools includes MHC class I & II binding predictions, peptide processing predictions and immunogenicity predictions.
- B Cell Epitope Prediction Tools**
The tools here are intended to predict regions of an antigen that may be recognized as epitopes in the context of a B cell.
- Analysis Tools**
The epitope analysis tools are intended for the analysis of an epitope sequence or group of sequences.

START YOUR SEARCH HERE

- Epitope**

 Allergic Disease
 Autoimmune Disease
Ex: asthma, diabetes

Epitope Analysis Resource

- T Cell Epitope Prediction**
Scan an antigen sequence for amino acid patterns indicative of:
MHC I Binding
MHC II Binding
MHC I Processing (Proteasome, TAP)
MHC I Immunogenicity
- B Cell Epitope Prediction**
Predict linear B cell epitopes using:
Antigen Sequence Properties
Predict discontinuous B cell epitopes using antigen structure via:
Discotope
ElliPro
- Epitope Analysis Tools**
Analyze epitope sets of:
Population Coverage
Conservation Across Antigens
Clusters with Similar Sequences

Upcoming Events

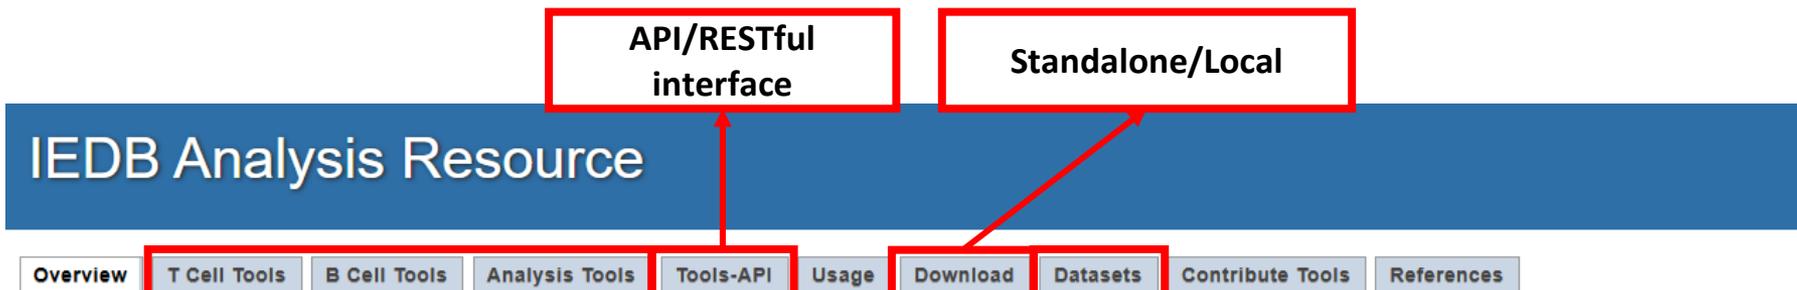

2-day User Workshop (details)	Nov 7-8
* webcast available	
Antibody Society Booth	Dec 9-13
AAAAI 2020 Booth	Mar 13-16
AAI 2020 Booth	May 8-12
FOCIS 2020 Booth	June 23-26

Summary Metrics

Peptidic Epitopes	592,423
Non-Peptidic Epitopes	2,810
T Cell Assays	364,879
B Cell Assays	484,136
MHC Ligand Assays	1,207,448
Epitope Source Organisms	3,761
Restricting MHC Alleles	785

Available Resources

Epitope Prediction and Analysis Tools

Welcome to the Immune Epitope Database Analysis Resource. This site provides a collection of tools for the prediction and analysis of immune epitopes. It serves as a companion site to the [Immune Epitope Database \(IEDB\)](#), a manually curated database of experimentally characterized immune epitopes.

The tools contained fall into the following categories:

T Cell Epitope Prediction Tools

This set of tools includes MHC class I & II binding predictions, as well as peptide processing predictions and immunogenicity predictions.

B Cell Epitope Prediction Tools

The tools here are intended to predict regions of proteins that are likely to be recognized as epitopes in the context of a B cell response.

Analysis Tools

The epitope analysis tools are intended for the detailed analysis of a known epitope sequence or group of sequences.

IEDB-AR News

• We're Hiring

[Bioinformatician for the Immune Epitope Analysis Resource](#)

• Python 3 availability

As of 2 July 2020, all code has been ported to Python 3, including the standalone tools. Thanks for your patience and be sure to [inform us](#) of any issues that arise.

T Cell Epitope Prediction Tools

T Cell Epitopes - MHC Binding Prediction

These tools predict IC50 values for peptides binding to specific MHC molecules. Note that binding to MHC is necessary but not sufficient for recognition by T cells.

Peptide binding to MHC class I molecules

This tool will take in an amino acid sequence, or set of sequences and determine each subsequence's ability to bind to a specific MHC class I molecule.

Peptide binding to MHC class II molecules

This tool employs different methods to predict MHC Class II epitopes, including a consensus approach which combines NN-align, SMM-align and Combinatorial library methods.

TepiTool:

The Tepitool provides prediction of peptides binding to MHC class I and class II molecules. Tool is designed as a wizard with 6 steps as described below. Each field (except sequences and alleles) is filled with default recommended settings for prediction and selection of optimum peptides. The input parameters can be adjusted as per your specific needs. You can go back to previous steps to change your selection before submission of the job. Once you submit the job (at the end of step-6), you will not be able to make any more changes and will have to start the prediction all over again with updated input parameters.

T Cell Epitopes - Processing Prediction

These tools predict epitope candidates based upon the processing of peptides in the cell.

Proteasomal cleavage/TAP transport/MHC class I combined predictor

This tool combines predictors of proteasomal processing, TAP transport, and MHC binding to produce an overall score for each peptide's intrinsic potential of being a T cell epitope.

Neural network based prediction of proteasomal cleavage sites (NetChop) and T cell epitopes (NetCTL and NetCTLpan)

NetChop is a predictor of proteasomal processing based upon a neural network. NetCTL and NetCTLpan are predictors of T cell epitopes along a protein sequence. It also employs a neural network architecture.

MHC-NP: Prediction of peptides naturally processed by the MHC

MHC-NP employs data obtained from MHC elution experiments in order to assess the probability that a given peptide is naturally processed and binds to a given MHC molecule. This tool was the winner of the [2nd Machine Learning Competition in Immunology](#).

MHCII-NP:

This tool utilizes MHC II ligand elution data to predict naturally processed MHC II ligands by scanning the given peptide sequences.

T Cell Epitopes - Immunogenicity Prediction

This tool predicts the relative ability of a peptide/MHC complex to elicit an immune response.

T cell class I pMHC immunogenicity predictor

This tool uses amino acid properties as well as their position within the peptide to predict the immunogenicity of a class I peptide MHC (pMHC) complex.

Deimmunization:

The deimmunization tool is attempt to identify immunodominant regions in a given therapeutically important protein, and suggest amino-acid substitutions that create non-immunogenic versions of the proteins. So we have opted a two steps process; 1) In the first step, the deimmunization tool will list all the immunogenic regions or peptides based on selected threshold. These peptides will be generated from the protein with 15mer window size and 10mer overlap. 2) In the second step, the user can select one or more

REVIEW: Review selections, enter job details & submit data:

Summary:

No. of sequences	1
Host species	Human
Allele class	Class II
Alleles	1.DRB1*01:01
Duplicate peptides	Removed
Peptide lengths selected	15mers (Only one length for class II)
Approx no. of peptides included	8
Peptide overlap	10 AA residues
Conservancy analysis	Peptides conserved in at least % sequences
Prediction method	NetMHCIIpan
Peptide selection criterion	Based on predicted consensus percentile rank (Cutoff selected = 10)

Job details:

Job name (optional)	<input type="text" value="sample"/>
Email (optional - will notify when job is finished)	<input type="text" value="spaul@lji.org"/>

(Please note that you will not be able to make any more changes once submitted. You will have to start again if you want to do so.)

B Cell Epitope Prediction Tools

B Cell Epitope Prediction

[Prediction of linear epitopes from protein sequence](#)
A collection of methods to predict linear B cell epitopes based on sequence characteristics of the antigen using amino acid scales and HMMs.

[Discotope - Prediction of epitopes from protein structure](#)
This method incorporates solvent-accessible surface area calculations, as well as contact distances into its prediction of B cell epitope potential along the length of a protein sequence.

[ElliPro - Epitope prediction based upon structural protrusion](#)
This method predicts epitopes based upon solvent-accessibility and flexibility.

[Methods for modeling and docking of antibody and protein 3D structures](#)
This page provides information on available methods for modeling and docking of antibody and protein 3D structures.

Structure Tools

 [LYRA \(Lymphocyte Receptor Automated Modelling\):](#)
The LYRA server predicts structures for either T-Cell Receptors (TCR) or B-Cell Receptors (BCR) using homology modelling. Framework templates are selected based on BLOSUM score, and complementary determining regions (CDR) are then selected if needed based on a canonical structure model and grafted onto the framework templates.

 [SCEptRe: Structural Complexes of Epitope Receptor](#)
SCEptRe provides weekly updated, non-redundant, user customized benchmark datasets with information on the immune receptor features for receptor-specific epitope predictions. This tool extracts weekly updated 3D complexes of antibody-antigen, TCR-pMHC and MHC-ligand from the Immune Epitope Database (IEDB) and clusters them based on antigens, receptors and epitopes to generate benchmark datasets. Users can customize structural quality and clustering parameters (e.g. resolution, R free factors, antigen or epitope sequence identity) to generate these datasets based on their need.

 : Tools under AR Labs which are experimental and are not quite ready for production yet. They are intended for further research, updates and testing.

Standalone (local) version

tools.iedb.org/main/download/

The screenshot shows the IEDB Analysis Resource website. The navigation bar includes tabs for Overview, T Cell Tools, B Cell Tools, Analysis Tools, Tools-API, Usage, Download (highlighted with a red box), Datasets, and Contribute. Below the navigation bar, the page is titled "IEDB Tools Downloads" and lists various tools available for download, including a virtual machine image and several standalone command-line tools.

IEDB Analysis Resource

Overview | T Cell Tools | B Cell Tools | Analysis Tools | Tools-API | Usage | **Download** | Datasets | Contribute

IEDB Tools Downloads

Complete Download: IEDB Analysis Resource Virtual Machine Image
For users that would like to run the entire analysis resource locally, a virtual machine image file is available with a patch kept in sync with the current version of the IEDB Analysis Resource and is updated on a six month cycle. Please [contact us](#) to inquire about a commercial license or if you have any questions in general. For a complete list of versions, please click [here](#).

Standalone Downloads
Many of the tools hosted on the IEDB-AR are available as command-line tools. They are freely available to academic users. Please [contact us](#) to inquire about a commercial license or if you have any questions in general. For a complete list of versions, please click [here](#).

- Linear B cell epitope predictor**
This allows for scoring of amino acid residues using the 6 scale-based methods of the linear B cell epitope predictor.
 - [Linear B cell epitope predictor](#)
- MHC class I & II epitope predictors**
For users with batch processing needs, the MHC class I and II binding prediction tools are available as standalone command-line tools. These tools are kept in sync with the web tools and should therefore produce the same results as clicking through the web interface.
 - [MHC Class I](#)
 - [MHC Class II](#)
- EIIIPro**
This will produce the same output as the web version of the tool but does not include the initial template finding function. Usage instructions are printed by calling the program without any parameters.
 - [EIIIPro](#)
- Class I Immunogenicity**
This tool uses amino acid properties as well as their position within the peptide to predict the immunogenicity of a peptide.
 - [Class I Immunogenicity](#)
- Proteasomal Cleavage Prediction**
The distributions 'IEDB_NetChop-1.0.tar.gz' contains methods for NetChop, NetCTL and NetCTLpan. NetChop is a predictor of proteasomal processing based upon a neural network. NetCTL is a predictor of T cell epitopes. NetCTLpan employs a neural network architecture. NetCTLpan is an update to the original NetCTL server that allows for prediction of MHC molecules of known protein sequence.
 - [Proteasomal Cleavage Prediction](#)
- Population Coverage**
This tool calculates the fraction of individuals predicted to respond to a given epitope set on the basis of HLA genotype, MHC binding and/or T cell restriction data. HLA allele genotypic frequencies were obtained from [Allele Frequency Database](#).
 - [Population Coverage](#)

- Run programs on your local machine
- Advantages:
 - No internet needed
 - Very helpful in case of large data sets
 - Free for non-profit & academia
 - Available for industry at a nominal fee
- license@iedb.org

API version (RESTful interface)

tools.iedb.org/main/tools-api/

The screenshot shows the IEDB Analysis Resource website. The 'Tools-API' tab is highlighted with a red box. Below the navigation bar, the 'RESTful interface (IEDB-API):' section is visible. A red box highlights the 'Examples for Class-I binding prediction' section, which contains five numbered examples and a table of available methods and versions.

RESTful interface (IEDB-API):

Several IEDB Analysis tools can now be accessed via the RESTful (Representational State Transfer) Web Services. This service is currently available for MHC-I and MHC-II binding, MHC-I processing and MHC-NP predictions for T-cell epitopes. The service sends POST request to the tools server, and relies on user supplied parameters. Below are some examples for accessing the service using the 'curl' program. Note that any program that sends POST requests to the server will work just as well (including a web browser). The full list of parameters and their values for MHC I and MHC II-binding, MHC I-processing and MHC-NP predictions are given in the table below. Please use these services instead of screen-scraping.
In release 2.15, a new API system for the class I binding predictions was made public. For end users, it should result in faster prediction times over the previous iterations, especially for large batches of sequences and CPU-intensive methods such as NetMHCpan and PickPocket.
** If relevant services are missing, please [contact us](#).*

Examples for Class-I binding prediction

- 1) To run a single allele and length combination:

```
$ curl --data "method=smm;sequence_text=SLYNTIVATLYCVHQRIQV;allele=HLA-A*01:01;length=9" http://tools-cluster-interface.iedb.org/tools_api/mhci/
```
- 2) To specify a version for methods:

```
$ curl --data "method=ann-3.4;sequence_text=ARFTGIKTA;allele=HLA-A*01:01;length=9" http://tools-cluster-interface.iedb.org/tools_api/mhci/
```

A "-" is used to separate method name and method version. If the version is not specified, the default version will be chosen. The available versions of the methods are listed below.

Available methods	Available versions
ann	4.0 (default), 3.4
comblib_sidney2008	1.0 (default)
consensus	2.18 (default)
netmhccons	1.1 (default)
netmhcpn_ba (netmhcpn)	4.0 (default), 2.8, 3.0
netmhcpn_el	4.0 (default)
netmhctabpan	1.0 (default)
pickpocket	1.1 (default)
recommended	2.19 (default), 2.18
smm	1.0 (default)
smmpmbec	1.0 (default)
- 3) To run multiple allele and length combinations:

```
$ curl --data "method=recommended;sequence_text=SLYNTIVATLYCVHQRIQV;allele=HLA-A*01:01,HLA-A*02:01;length=8,9" http://tools-cluster-interface.iedb.org/tools_api/mhci/
```
- 4) To submit multiple sequences at a time, escape the special characters in a fasta-formatted sequence with URI codes.
E.g., we can predict for 2 sequences (with fasta names peptide1 and peptide2) with the following code:

```
$ curl --data "method=ann;sequence_text=%3Epeptide1%0AGHAKVPRRLKAR%0A%3Epeptide2%0ALKAADASADAGSGSGS;allele=HLA-A*01:01,HLA-A*03:01;length=9,10" http://tools-cluster-interface.iedb.org/tools_api/mhci/
```
- 5) To receive the prediction result in you email address, input your email address with a parameter "email_address".
E.g., we can send the prediction result to the email address "youremail@example.com" (**Don't forget to use your email address to replace it.**) with the following code:

```
$ curl --data "method=recommended;sequence_text=SLYNTIVATLYCVHQRIQV;allele=HLA-A*01:01,HLA-A*02:01;length=8,9;email_address=youremail@example.com" http://tools-cluster-interface.iedb.org/tools_api/mhci/
```

- Sends prediction request to the tools server at LJI
- No need to install tools on your machine
- Freely available to all users
- Can be incorporated in prediction pipelines
- Automatic update without reinstalling

Versions of IEDB Analysis Resource tools

Web

<http://tools.iedb.org>

- Client uses browsers to submit data
- Predictions run on IEDB tools server
- Can be run on Windows/Mac/Linux
- Internet is needed
- May not be suitable for very very large data sets
- Automatically updated

Standalone

<http://tools.iedb.org/main/download>

- Uses command line interface
- Downloaded from IEDB website
- Installed and run on local machine
- Runs on Linux only (can use virtual machines to run Linux on other OS)
- Internet not needed once installed
- Better for very large data sets
- Need to update for every release
- Free to academia/non-profit; License fee for industry

API

<http://tools.iedb.org/main/tools-api>

- Uses command line interface
- Predictions run on IEDB server
- Clients send parameters to IEDB server using commands or scripts
- Internet is needed
- Can be used to make custom scripts for use with large data sets
- Automatically updated
- Free to all

Points to remember

- First stop is IEDB database
- Epitope prediction tools extrapolate from existing data to identify new candidate epitopes
 - ‘Machine learning’ approaches identify patterns
 - ROC curves / AUC values as preferred performance metrics
 - Prediction is a screening step, not confirmatory
 - Predicted peptides should be experimentally verified
- Analysis tools help to examine existing sets of epitopes and gain new knowledge
 - No single metric of performance
 - Broad array of applications
